Welcome, world

Welcome to Brewbean's, your ultimate online destination for all things coffee. We're more than just a retailer - we are your trusted partner in the pursuit of the perfect brew. With our carefully curated selection of the finest coffee beans, equipment, and accessories from around the globe, we bring the world of premium coffee right to your doorstep. Whether you're a seasoned coffee connoisseur or new to the brew, at Brewbean's, we are committed to fueling your coffee journey with our passion, knowledge, and commitment to quality. Dive into our world, and let Brewbean's elevate your coffee experience.

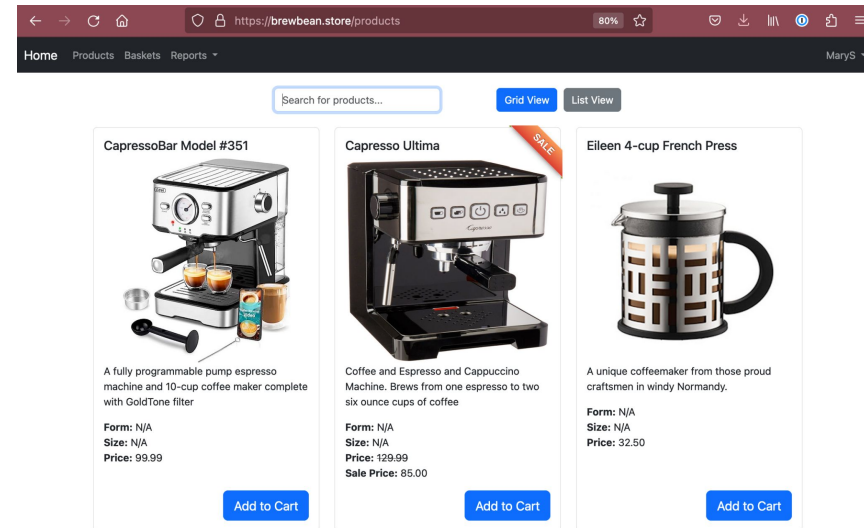

"The selection and customer service at Brewbean's is top-notch. They've helped me discover new blends I wouldn't have tried otherwise."

- Jane Doe, Mississauga

Brewbean - Site Navigation

- Brewbean's Coffee is an online retailer that sells coffee-making equipment and coffee beans
- Shoppers can search or browse products, add products to their cart, create an account, and view those cart items in their basket
- Additionally, users with Employee or Admin access can add products, edit product descriptions and view reports about each shopper and their total spend on the site
- We will demonstrate the navigation with a live demo after this presentation

Brewbean - System Configuration

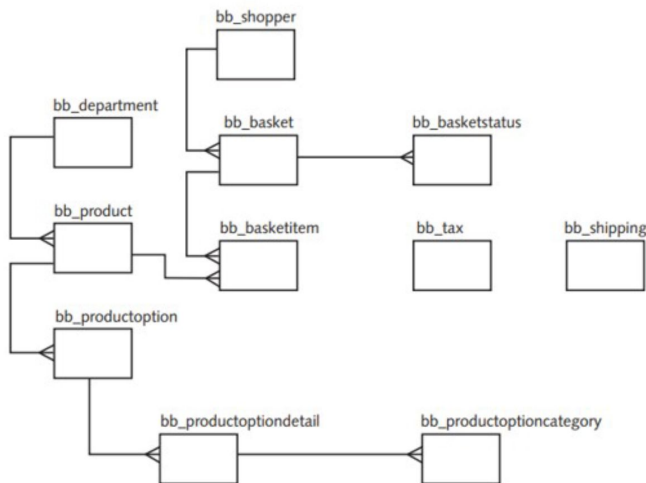

Core Technologies

- MySQL Server 8.0.33
- Navicat for MySQL
 - For creating stored procedures and other data table structures
- Python3 + Flask 2.3.2
 - We utilized Flask to extend the python language to allow us to build html templates
- VIM and VSCODE for editing HTML and python files
- See the github repo for the latest MySQL build script for the project
 - Converted the original Oracle SQL dataset to MySQL

Additional Server Detail

- Domain name bought from gandi.net for \$1 (annual)
- DigitalOcean Ubuntu VM \$3 (monthly)
- LetsEncrypt SSL certificate \$0

Brewbean - Frontend

Brewbean - Example - Generating products.html

app.py

```
@app.route('/products')
def products():
    if current_user.is_authenticated:
        products = sql.call_stored_procedure(
            'get_products_by_usergroup', (current_user.usergroup, ))
    else:
        products = sql.call_stored_procedure(
            'get_products_by_usergroup', (const.GUEST, ))

    # Render the products page with the retrieved products
    return render_template('products.html', data=products)
```

products.html

```
<!-- Products container -->
<div class="container my-4">
  <div id="productsContainer" class="row">
    {% for row in data %}
      <div class="product-item col-12 col-md-6 col-lg-4 grid d-flex">
        <div class="card">
          <div class="card-body d-flex flex-column">
            <h5 class="card-title">{{ row.ProductName }}</h5>
            {% if current_user.usergroup in [1, 2] %}
              <div class="row">
                <div class="col-6">
                  <strong>Product Id:</strong>
                </div>
                <div class="col-6 card-id">
                  <strong>{{ row.idProduct }}</strong>
                </div>
              </div>
            {% endif %}
          </div>
        </div>
      </div>
    {% endfor %}
  </div>
</div>
```

sql.py

```
def call_stored_procedure(proc_name, params=(), fetchone=False, update=False):
    connection = create_connection()
    cursor = connection.cursor(dictionary=True)

    try:
        cursor.callproc(proc_name, params)
        connection.commit() # Commit the transaction
        if fetchone:
            for result in cursor.stored_results():
                return result.fetchone()
        elif update:
            return True
        else:
            results = []
            for result in cursor.stored_results():
                results.extend(result.fetchall())
            return results
    except mysql.connector.Error as err:
        print(f"Error: {err}")
        connection.rollback() # Rollback the transaction
        return None

    finally:
        cursor.close()
        connection.close()
    return True
```

MySQL DB

```
CREATE DEFINER='breweryapp'@'%' PROCEDURE `get_products_by_usergroup`
IN idUsergroup INT)
BEGIN
  CASE idUsergroup
    WHEN 1 THEN
      SELECT *, get_sale_info(idProduct,CURRENT_DATE()) SaleFlag
      FROM bb_product_admin;
    WHEN 2 THEN
      SELECT *, get_sale_info(idProduct,CURRENT_DATE()) SaleFlag
      FROM bb_product_employee;
    WHEN 3 THEN
      SELECT *, get_sale_info(idProduct,CURRENT_DATE()) SaleFlag
      FROM bb_product_shopper_guest;
    WHEN 4 THEN
      SELECT *, get_sale_info(idProduct,CURRENT_DATE()) SaleFlag
      FROM bb_product_shopper_guest;
    ELSE
      SIGNAL SQLSTATE '45000'
      SET MESSAGE_TEXT = 'Invalid user group provided';
  END CASE;
END
```

Brewbean - Requested Tasks / Reports

Tasks

1. Create functionality to alter a product's description
2. Create functionality to add a product
3. Calculate tax on the order
4. Updating the order status
5. Add items to a basket
6. Identify and flag products on sale

Reports

1. Generate a report to show whether all items in a shopper's basket are in stock or not
2. Generate a report that calculates each shopper's total spend

Brewbean - Bonus Features

1. Session Control
 - System facilitates logging users in and out
2. New (Shopper) Account Registrations
 - Stored passwords are hashed in the database
3. Auditing logon and employee actions (requires admin access to view)
4. Usergroups
 - Guest (anonymous): View homepage and products
 - Shopper: + Place orders, View basket data, Edit profile, View Stock Report
 - Employee: + Edit products, Update Order Status, View **all** basket data, View Purchase Report
 - Admin: + View Logon and Employee Audits
5. Edit profile
 - Personal information (shoppers)
 - Update password (everyone)
6. Multiview products page (List view & Grid View)
7. Searching Basket Data (Employees and Admins)

Brewbean - Demo time!
